STORY AT-A-GLANCE

- An urgent and immediate response to assess whether COVID-19 shots — of which more than 13.7 billion doses have been given — are causing heart damage and related deaths should be conducted
- Instead, a propaganda campaign appears to be underway to blame the surplus heart attacks on other factors
- Investigative journalist Corey Lynn compiled 28 media examples proving heart attacks on unscientific causes that don't explain the sudden increase in heart problems that have occurred since COVID-19 shots were mass administered
- If you listen to these experts, if it's hot or cold, you're crying or old, you garden or shower, or you're happy or stressed, you're at risk
- "The so-called 'experts' and their friends in the media are covering up adverse events and deaths caused by the Covid injections," according to Lynn

Since the rollout of COVID-19 shots, a concerning rise in heart attacks and other heart problems has been reported, particularly in young, healthy people — those you wouldn't expect to have cardiac trouble.

This should prompt an urgent and immediate response to assess whether COVID-19 shots — of which more than 13.7 billion doses have been given — are causing heart damage and related deaths. The media, too, should be bringing attention to this association, to educate the public and prompt action from regulatory agencies.

Instead, a propaganda campaign appears to be underway to blame the surplus heart attacks on other factors. They're really grasping at straws, though, as you'll see in some of these "heart attack risks" they're coming up with.

It's also ironic that while studies showing a link between COVID jabs and heart attacks are being flagged as misinformation, these far-fetched associations that truly lack scientific support are not.

Studies Point to COVID Shots Triggering Heart Trouble

One of the most revealing studies came from Israel, where calls to the National Emergency Medical Services (EMS) for cardiac arrest and acute coronary syndrome increased more than 25% among 16- to 39-year-olds from January to May 2021, compared to the same time period in 2019 and 2020.[1]

Both COVID-19 infection and COVID-19 shots have been implicated in causing heart trouble, but a statistically significant association was only found for COVID-19 shots, not the infection.[2]

> *"Moreover, there is a robust and statistically significant association between the weekly CA and ACS call counts, and the rates of 1st and 2nd vaccine doses administered in this age group. At the same time there is no observed statistically significant association between COVID-19 infection rates and the CA and ACS call counts.*
>
> *These results ... are mirrored by a report of increased emergency department visits with cardiovascular complaints during the vaccination rollout in Germany as well as increased EMS calls for cardiac incidents in Scotland."*

There are also growing reports of elite athletes who have experienced devastating injuries after receiving COVID-19 shots. After receiving his second dose of Pfizer's COVID-19 injection, Florian Segouy, a world-record holder in static breath-hold freediving, experienced increased heart rate and a reduction in his breath-holding capacity.

A cardiologist diagnosed him with myocarditis, or inflammation of the heart muscle, and pericarditis, which is inflammation of the outer lining of the heart.[3] Both are recognized adverse effects linked to the shots. In another example, a previously healthy 36-year-old mother of two died 11 days after receiving a Pfizer COVID-19 shot; her death was deemed to be caused by myocarditis due to the shot.[4]

Dr. Neil Singh Dhalla, a CEO of a major health clinic, fell asleep four days after he got a COVID-19 booster shot — and died from a heart attack.[5] The autopsy stated myocarditis. He was only 48 years old and had never had heart problems in his life.

A Thailand study also revealed "cardiovascular manifestations" including rapid heartbeat (tachycardia), palpitation and myopericarditis in 29.24% of adolescents who'd received an mRNA COVID-19 shot.

28 Absurd Heart Attack Causes From 'Experts'

As noted by investigative journalist Corey Lynn:[6]

> *"According to 'experts' and their allies in the media, the recent rise in heart attacks must be due to anything but the Covid injection. These so-called 'experts' are working at 'the speed of science' to come up with every excuse under the sun, other than the most obvious reason, for the rise in fatal heart conditions."*

Lynn compiled 28 examples from the media proving heart attacks on unscientific causes that don't explain the sudden increase in heart problems that have occurred since COVID-19 shots were mass administered.[7] If you listen to these experts, if it's hot or cold, you're crying or old, you're happy or stressed, you're at risk. The first set has to do with weather.

FREE! Download this Article Before It Disappears
Download PDF

Hot Outside? Cold Outside? Humid? You're at Risk

"Hot weather, cold weather, solar storms, daylight savings ... it doesn't matter," Lynn says. "For every season, there is a reason for the rise in fatalities (other than the Covid injection of course!)":

1. **Extreme heat waves** — Increasing temperatures leading to extreme heat waves were blamed for affecting heart health, especially among people of color.[8]
2. **New 'highly reactive' chemical in the atmosphere** — The chemicals, triosides, have three oxygen atoms and are said to penetrate airborne particles known as aerosols, which can trigger heart disease. "It is easy to imagine that new substances are formed in the aerosols that are harmful if inhaled," professor Henrik Gram Kjærgaard with the University of Copenhagen's department of chemistry told Daily Mail.[9]
3. **Slightly hotter nights** — If the temperature rises 1 degree Celsius, it raises the risk of death from cardiovascular disease by 3.1% in men aged 60 to 64, "but not older men or women in either age group."[10]
4. **Humid weather** — If the weather is humid, watch out. Professor James Spratt, consultant cardiologist at London Bridge Hospital, told Express.co.uk, "Heat can be thought of as stress on the heart. While short exposure to heat, such as in saunas, can be beneficial, if prolonged it can be harmful. The body works hard to maintain a steady core temperature, primarily by diverting blood from internal organs to the skin."[11]
5. **Cold weather** — If it's chilly outside, blood clots and heart attacks are more likely.[12]
6. **Shoveling snow** — About 100 people die from shoveling snow every year, according to The National Safety Council, as the strenuous activity increases risk of heart attack or cardiac arrest.[13]
7. **Solar storms** — Solar storms reported cause up to 5,500 heart-related deaths in the U.S. in events that occur every 11 years, due to disruptions in the Earth's magnetic field.[14]
8. **Daylight saving time** — The transition to daylight saving time is also said to put your heart health at risk. "We don't really know the specific reason for increases in heart disease and stroke during the daylight saving time change, but it likely has something to do with the disruption to the body's internal clock, or its circadian rhythm," Donald M. Lloyd-Jones, president of the American Heart Association, told the Toronto Sun.[15]
9. **'Stroke season'** — Dr. Raj Bhardwaj says he didn't know about this until 2022, but "it turns out that about three to four weeks after flu season, there's a stroke season. "The good news," he says, "is that getting a flu shot reduces your risk of stroke."[16] "Did you know there is a 'stroke season'? Well, that's what the 'experts' say, so it must be true," Lynn says.[17]

Tall, Healthy and Like to Exercise? Sarcastic? You're at Risk

This next set also highlights that no matter your age or current mood, your heart attack risk could be on the rise. Lynn says:[18]

> *"Whatever age, attitude, or mood, there's an excuse for your 'mood, old, tall, healthy, sick, active, happy, lonely, stressed' — according to the 'experts' the latest Killer' could strike anyone. Definitely DO NOT ask 'What do these disease groups have in common?' (Turns out, even sarcasm increases your risk. If that's the case, I'd better see a doctor quickly)"*

10. **Teenagers** — If you're a teenager, the American Academy of Pediatrics now recommends you get screened for heart attack risk, because, in case you weren't aware, "any teenager can have a heart attack."[19]
11. **Fit and healthy young women** — Spontaneous coronary artery dissection (SCAD) can cause a heart attack in healthy women as young as 22.[20]
12. **Lonely older women** — If you're socially isolated or lonely, and between the ages of 65 and 99, you're at greater risk of heart attack.[21]
13. **Tall people** — Tall people have an increased risk of heart, nerve and skin diseases.[22]
14. **COVID-19 infection** — Surges in COVID-19 infections are linked with increases in heart attacks, especially among 25- to 44-year-olds.[23]
15. **Physical activity** — High levels of physical activity may increase your heart attack risk by hastening the buildup of plaque in your coronary arteries.[24]
16. **Joyful events** — Birthday party? Wedding? Birth of a grandchild? These joyous events increase your risk of heart attack. It's known as "happy heart syndrome."[25]
17. **Pandemic stress** — Stress due to the pandemic may be behind the recent surge in heart attacks.[26]
18. **Blue in energy bill** — Increases in your gas and electricity bills could increase risk of heart attacks and strokes.[27]
19. **Delayed flight** — Flight delays and refund issues put you at risk of "silent killers," like heart disease.[28]
20. **Sarcasm** — If you're sarcastic, you're at greater risk of a heart attack.[29]

Shower? Garden? Play Video Games? You're at Risk

From eating eggs to skipping breakfast — both arguably health-boosting habits — to engaging in gardening, the media's fearmongering makes it seem as though nothing is sacred, or safe. Lynn notes:[30]

> *"Do you live in a noisy area? Guess what? You may be at risk! Do you fall asleep with the TV on? You guessed it. You're at risk! Don't watch an exciting movie. You might be at risk! And you can forget about scrolling through social media, playing video games, or sports. If you thought gardening was safe, you were WRONG!"*

21. **Living under a flight path** — If you live under a flight path, the noise from the planes may be increasing your heart attack risk by 72%.[31]
22. **Watching an exciting movie** — A man who died while watching the movie *Avatar 2* reportedly suffered an "excitement-induced heart attack."[32]
23. **Anti-vax misinformation** — If someone reads "misinformation perpetuated by the anti-vaccination movement" and then gets a shot, the mental stress it causes then could lead to constrictions of veins, arteries and vessels, which then causes all these COVID shot side effects we hear about. This is according to Raymond Palmer of Full Spectrum Biologics, who wrote:[33]

> *"This biological mechanism (the constriction of veins, arteries and vessels under mental stress) is the most likely cause for where there has been blood clots, strokes, heart attacks, dizziness, fainting, blurred vision, loss of smell and taste that may have been experienced shortly after vaccine administration.*
>
> *The extreme mental stress of the patient could most likely be attributed to the fear mongering and scare tactics used by various anti-vaccination groups."*

24. **Video games** — Playing video games can trigger rare heart attacks in children.[34]
25. **Cold showers** — This could trigger a heart attack or heart rhythm irregularities by shocking your blood vessels.[35]
26. **Gardening** — Don't even think about trying to grow your own healthy food. Pollutants in the soil could "have a detrimental effect on the cardiovascular system" and increase your risk of heart disease.[36]
27. **Eggs** — Choline in eggs could make your blood more likely to clot, leading to enhanced risk of blood clots.[37]
28. **Skipping breakfast** — If you skip breakfast, your risk of dying from all causes increases by 32% while your heart attack risk rises by 21%.[38]

While some of these studies may highlight legitimate risks in certain cases, it's curious that obscure factors like watching an exciting movie and gardening are getting air time, while adverse events scientifically linked to COVID jabs are not.

"You get the picture," Lynn says. "The so-called 'experts' and their friends in the media are covering up adverse events and deaths caused by the Covid injections, but by all means — keep 'trusting the science.'"[39]

My #1 Best-selling Book – Now in Paperback!

My latest book, "The Truth About COVID-19," is an instant best-seller. After thousands of reviews it has a nearly perfect 5-star rating, so grab your copy today before it's too late!

The sponge between the stenos caused by restrictive processes and the false nerve of Covid-19 mortality the stress of daily life and the mRNA bioweapons and metabolic disease created by nutrition programs supported by BigPharma and the globalist elite I'm sure they have a lot to do with heart attacks. Mother Nature gives us many solutions to prevent disease and to treat it. Likewise, humanity is being subjected to a very serious problem of "kidnapping" and "contamination" of Allopathic Medicine by spurious and unpeatable interests, motivated by ambition and a monstrous greed.

Cardiovascular diseases rank first among the diseases that cause the most deaths in the world, responsible for 40.6% of all deaths in the world. Dr. Mark, who emphasized the need to build on the seven pillars of health, namely nutrition, sleep, stress management, movement, genetics, hormones avoiding metabolic diseases. Dr. Mark, who runs a full-time wellness-based medical practice in Tulsa, Oklahoma, along with his wife, Dr. Michelle, said stress is one of humanity's most obvious killers right now and many do not understand the idea of being stressed.

"Many people end up with hypertension. Sometimes they end up with high blood sugar which can eventually result in low blood sugar. Also a kind of shock to the adrenal glands. The adrenal glands just can't keep up. So stress is hugely important today," said Dr. Mark, adding that it is important to define stress properly and to recognize what the inappropriate definition of stress is.

Multiple reports seem to support the belief that acute psychological stress can precipitate myocardial dysfunction, infarction, arrhythmia, and cardiac death. Activation of cardiac sympathetic outflow and inhibition of cardiac vagus are important mediating mechanisms. Acute stress causes a high amount of catecholamines to be secreted into the blood. These hormones can cause many changes in the body, such as rapid heartbeat, high blood pressure, coronary vasoconstriction, and/or stress cardiomyopathy.

Chronic psychological stress is associated with increased risk of heart disease. With an increase in the level of anxiety, there is a change in the activity of the sympathetic-adrenal, hypothalamic-pituitary-adrenal and renin-angiotensin-aldosterone systems. In addition, it is naturally accompanied by changes in carbohydrate, protein, and lipid metabolism, procoagulant changes in hemostasis, and impaired vascular endothelial function. All of these disorders can lead to increased progression of atherosclerosis, increased coronary vascular tone, increased platelet aggregation, increased platelet adhesion, a tendency to thrombosis, and contribute to a worsening of the course of coronary heart disease.

When we experience constant stress, our amygdala signals the bone marrow to produce more white blood cells, which causes leukocytosis. This in turn causes the arteries to become inflamed and can cause some cardiovascular problems and others as mentioned before: Heart attacks, angina and stroke.

Also a team of scientists from McMaster University in Ontario (Canada) has studied the link between the use of antidepressants and the risk of mortality, through a meta-analysis of existing research from various medical databases, looking for a link between the mortality and the use of antidepressants. The analysis included 16 studies, with approximately 315,000 participants. They extracted data on cardiovascular disease, cardiovascular risk, and the type of antidepressants taken. They then used a mixed effects model to carry out their meta-analysis, controlling for depression and other diseases. The results revealed that, in the general population, people being antidepressants had a 33% higher risk of dying prematurely than people not taking these drugs.

Additionally, antidepressant users were 14% more likely to have an adverse cardiovascular event, such as a heart attack. ===== www.brighteon.com/5061c5ec-9ded-4a0c-98cb-8f0b0d01f1f7 ===== www.cbsnews.com/health/antidepressant-use-linked-to-higher-risk-of-prem... ===== www.medicalnewstoday.com/.../319462 ===== www.sciencedirect.com/.../S0005291523001371 ===== pubmed.ncbi.nlm.nih.gov/.../7024 (2002) ===== www.sciencedirect.com/science/article/abs/pii/S0165032106001357 (2022) ===== www.ncbi.nlm.nih.gov/pmc/articles/PMC7... guillermou Reading the paper The Citing of America tells us that pre the introduction of seed oils, there were essentially very few reports of its quote pus: "myocardial dysfunction, infarction, arrhythmia, and cardiac death". So in which case, the facts surely speak for themselves.

Only thing they missed causing heart attacks was the shock of the number when you step on the scale at the doctors office with clothes and shoes on and keys and things in your pockets. The list above is so insane it is radiculous. None of that stuff caused heart attacks before the covid shots, but all of a sudden it does. Cant keep lying, doctors keep lying. Be careful who you trust, always do your own research.

Exactly. Reminds me of the Beatles "Line and Let Die", in part: When you were young and your heart was an open book, You used to say live and let live. (You know you did, you know you did, you know you did) But if this ever-changing world in which we live in Makes you give in and say, Say live and let die! Live and let die, Live and let die, Big Pharma and the globalists love the die part, it's a money maker if they don't get you through abortion, perhaps 'vaccines', then their associated symptoms and further drug administering for each ensuing symptom until you succumb. What a racket, they're making a killing!

The gullible have forgotten it is not science/treatments/medicines that heal the body They only support the body's healing system to heal the body called the immune system Only natural healing from infection can cross life long immunity Vaccines only trigger immune system the reason for boosting Triggering the immune system constantly weakens it much like too much sugar weakening pancreas develops insulin resistance.

Its been a mise and repeat scenario for decades by Pharma and those they "pay off" to direct the narrative. Create the problem, make the $$$ and normalize all side effects to treat frightened people for life with other meds saying they are "here to help" The carbs get away with it almost every time. A disgrace considering the wealth of destruction in humanities existence done by this intentionality

My partner had prostate removal 2 months ago and I had a collapsed lung from an injury recently. While we were in overnight for one night in hospital in Australia, we had leg pumps attached to our lower legs. This is a recent thing as I've been in hospital overnight a few times in my past and they weren't used. The awful thing is, they keep you awake all night I'm thinking, is this the new normal? Could it have something to do with the fact most people have had the clot shots? Why just recently are hospitals worrying about everyone getting blood clots from lying in bed? My partner told a nurse he couldn't sleep and she said, You don't need them anymore. I just laid awake all night, but if I'm ever in hospital again I won't put up with them all night. How can you heal if you can't sleep? It was torture.

Before the Jab,it is rare and jaw dropping event to have healthy young people drop dead, even if they were engaged in a strenuous physical event. Usually there was an unknown underlying rare condition involved. Now it seems epidemic,but we won't get a Lockdown on what obviously so many of these young, too often not just healthy, but world class athletes have in common - the Jab,is the charts from all over the world reflect this reality. But we now live in the Upside Down. The Twilight Zone would have a hard time producing content today. We face a daily campaign of the Weird is normal.

The promoters of toxic mRNA gene modifying therapy branded vaccine can get all the professionals/specialists in the world to ignore the increased cases of heart issues and misdirect the cause but they cannot misdirect the fact that the increased cases especially in the very young have all been jabbed with a gene modifying drug.The common denominator in all this profiteering misery induced global narrative.Shame,shame,shame on all those promoters of toxic patented profiteering indemnified from financial liability/responsibility.

Lynn forgot to add erythritol as a blood clotting risk. I guess next they'll find out that exercise makes graphene appear in your blood. Or, maybe they'll say that grass-fed beef puts you at risk for sudden state 4 cancer.

Oh don't forget, Sunshine causes cancer. They're saving that attack for when they blame vitamin D3 for impacting your cholesterol levels and therefore causing heart attacks.

I have noticed more and more in the news people dying (especially younger) from heart-related issues ... my 1st thought is always 'I'm sure they were vaxxed'. Yet the majority of times the articles say they are "still investigating" or they just flat-out don't elaborate on anything. Covering their a$$.

Even if these absurd excuses were true, they would've been true before the roll out of the jabs so they still don't explain the excess deaths.

Pathologists have proven the shots are cause of death. They have removed blood clots up to 4 feet long never seen before. You think these shots are vaccines? Google what is a vaccine.

I see nowhere in that list poor diet, poor sleep habits, or lack of exercise or sunshine. I guess we can all assume that those don't contribute to heart disease.

I AM terribly sarcastic - where to begin? I'll avoid further comment to avoid the risk of keeling over.
