virus.

People who can think and follow a line of reasoning should have a shot at considering the questions:

Did researchers actually discover the virus?

Did their proof fall short?

DID RESEARCHERS DO ENOUGH TO PROVE THE CORONAVIRUS EXISTS IN THE FIRST PLACE?

If someone says that, during the full moon three weeks ago, the moon suddenly turned gold, and then a strange squadron of giants passed across it, on their way to the ocean, do you think it might be a good idea to find out whether, three weeks ago, there was a full moon? Might that be a basic starting point?

That's what I'm doing. Checking up to see whether there was a full moon.

A rational researcher, at the CDC, if one actually existed, would say, upon hearing of a possible outbreak in the city of Wuhan: “Let’s see the proof that a new virus is responsible, is the causative agent.”

What kind of proof would he be asking for?

First, he would want to know, “Do researchers there have an actual biological specimen of this new virus? Do they have the real thing?”

And if the answer came back yes, he would reply, “We’re sending in one of our Wuhan people so he can confirm that.”

But how would the confirmation work? You can’t just lay a specimen of a virus on a table and shine a light on it.

There is a traditional method of observation. It’s called an electron

Archives

Select Month

microscope photograph (an EM). Certain established procedures exist for obtaining an EM from a patient's tissue sample. The CDC scientist would want to make sure the Chinese scientists had carried out this process correctly.

Rough sketch: From a patient's tissue sample, you take a small bit and spin it in a centrifuge. The material settles out in layers.

Knowing which layer (by density) you're looking for, you remove a bit from that layer, look at it under an electron microscope and photograph it. If you've found a new virus, you should see many identical particles of it in the photo—and, obviously, it should be something you've never seen before.

The rational CDC scientist—if one actually existed—would say, “Let's have a look at the Chinese EM.” He wants to confirm there are

many identical particles of the new virus in the EM.

But there is more. And here is where the rubber meets the road and the failure factor is very high. I need to back up a bit to explain.

When a clinical trial of a new drug is done (and here I'll make a gigantic leap and assume it's done correctly), is it carried out on one patient?

Is the result of giving the drug to a single patient then extrapolated to mean everyone will react the way this one person did? Of course not. That would be absurd. In clinical trials, sooner or later, researchers are dealing with a large number of volunteers. A thousand or more.

So, in the case of a new coronavirus, in China, the rational CDC scientist would say: "I want to see electron microscope photographs derived from a

thousand patients who have been diagnosed with the new epidemic disease. I want to see those photos side by side. I want to see whether many particles of this same new virus are in all the photos.”

I myself ask, where are these photographs? Where are the completely necessary photographs? Because the Chinese scientist would tell his CDC counterpart, “Oh, we didn’t carry out the EM procedure on a thousand patients. We carried it out on one. Two. Maybe three. I’m not sure.”

At which point, this fantasy rational CDC scientist would blow his stack. He would say, “You’re declaring a new global epidemic based on two or three photographs from two or three patients??”

Consider this potential scenario—which explains why researchers only did

the EMs on two or three of the patients. If someone actually performed the electron microscope work on 1000 patients diagnosed with the new disease, he might find a maybe/possible indication, in the photographs, of a new coronavirus in four patients. AND IN NONE OF THE OTHER 997 PATIENTS.

At which point, in Wuhan, they would shrug and say, “Well, wow, that didn’t work out. What a flop. Our hypothesis of a new disease based on a new coronavirus collapsed. We should have been able to see lots of the same new virus in the photos from ALL 1000 patients, or at least the overwhelming percentage of them. And we didn’t. Back to the drawing board. Let’s see. What’s the primary sign of the new disease? Pneumonia? Come to think of it, about 300,000 people in China die of pneumonia

every year. How about we look at some studies on the air quality here in Wuhan? I think my colleague down the block has a pile of them. Let's walk over there. Anybody have a searchlight so we can see the street through the fog of deadly pollution? Let me get my oxygen tank and breathing helmet.”

And that would be the end of that.

Back in Atlanta, the fantasy rational CDC scientist would say to his colleagues, “That Chinese outbreak wasn't a virus. How about we spend the afternoon going through some of our own studies on vaccines? I know the fraud is rampant. Let's get it out in the open.”

Sure. Happens every day over at the CDC.

Of course, I could be wrong. Maybe someone has done electron microscope photographs **CORRECTLY**

derived from 1000 patients diagnosed with the new epidemic disease, in ONE LARGE COHERENT HONEST STUDY. LET'S SEE THE PHOTOS. SHOW THEM TO ME. We'll have a few non-conflicted experts analyze them. Then we'll demand another complete and honest study of 1000 patients, as confirmation.

Otherwise, don't talk about science. There is no science going on.

Talk about fakery. And liability. And prison.

I write this piece for those who ordinarily have their heads on straight, when it comes to understanding the basics of HEALTH—but now, because of the “coronavirus epidemic,” are drifting back into the medical model: FIXATION ON GERMS.

A correct reading of suppressed medical history reveals that the hypothesis

of “one disease, one germ” is a modern con, moving down a blind alley at midnight. And when you add “one vaccine” to the formula, you get an even greater degree of lunacy.

But you also get a trillion-dollar commercial success.

I don't care how many contemporary molecular biologists are working in labs, amplifying invisible slivers of who knows what molecules into view, and calling them viruses; it's a con. They're all working in the dark, massaging RNA or partial decaying microbes or cellular debris or exosomes or pieces of random genetic sequences or whatever...

The history of human health shows that upgrades in public sanitation, hygiene, and improved nutrition have done more for people than all the laboratory voodoo and “germ-fighting”

pharmaceutical
interventions ever invented
laid end to end.

You want germs? No one
knows how many there are.
From various estimates, we
could be talking about
thousands of trillions to the
thousandth power. Maybe
more. If an infinitesimal
fraction of the critters
caused serious disease no-
matter-what, we'd not only
all be dead, we'd be dead on
dead on dead.

To begin to understand how
overblown all these modern
epidemic duds are, let's go
to the animals. Farm
animals. Pigs. A headline
blares: A MILLION PIGS
SLAUGHTERED. African
Swine Fever Virus was
discovered, and in order to
stop the contagion, death
was rained down on the
pigs. On the farm. On the
giant factory farm. So a
question arises:

Do you seriously think

humans sat down next to each of the million pigs and tested him/her for the Virus? Drew a blood or tissue sample?

Twenty pigs “tested positive” and they killed the rest as matter of course. They always do.

But wait. What are the conditions on this massive million-pig factory farm? Let’s see. Pigs living in their own urine and feces, crowded next to one another, nose to butt, sprayed with toxic chemicals, eating chemical-laced feed—under high stress, never living the kind of existence they were designed for. Think they’re going to get sick? Think some kind of minimally reliable test might find a virus or two living and replicating in their bodies? Do you seriously think those viruses matter, contrasted against the **OBVIOUS**

immunosuppressive ENVIRONMENT?

As the number one germ hunter of all time, Louis Pasteur, was reported to have confessed on his deathbed: it's not the germ, it's the terrain—meaning, it's the body and its strength and vitality and resiliency—THAT should be the central focus of the healing profession. Building up health.

One problem. There's no money in it. There's no control over the population in it.

Oops.

Inoculate yourself against
the state.

But don't I need a license
from the state for that?

Oh, oh. The hypnosis is
complete.

Let the Holocoronadomor
commence! It's for the
children.

Awesome, thank you Jon.
Being rational and asking
for the actual science of the
"pandemic" is a big no-no.
You need to spread fear and
hysteria nonstop like ABC,
NBC, CBS, Fox, Facebook,
Google, Yahoo, Drudge, and
twitter.

Not spreading enough lies
and fear?? You're banned!

“COVID: is the virus real? ”

Of course it's real, I've seen pictures of it on the news, ever since it started!

Obviously it's real or they couldn't have pictures. Pictures don't lie. They're even in color!

And people are getting sick with it, and some even die. It's the worst thing ever, in the history of the world. Rescheduled baseball games have been cancelled, the rest of the season is uncertain....oh, the horror! (Please give those players that have 'tested' positive their privacy as they try to deal with the situation in these difficult times!)

And hospitals are soooooo full they've had to ban visitors, as well as lay off staff, because there are sooooo many patients that they can't fit any more people in the buildings. (And they need the parking lots for refrigerator trucks.)

And now it's starting to affect children, so that we can worry about opening schools and letting children go there to learn... something. If those children go to school and get the virus (it's real because I saw

the picture on the news), where will they go if the hospitals and parking lots are full?

We can only hope, pray, and trust that Bill Gates and Tony Fauci come up with a vaccine. Soon. Like warp-speed soon. It's the only way we are going to get back to normal. Except more testing. Because we are all in this together. But we should stay six feet apart. And wear a mask. (You can make one out of an old tee shirt.) Even the CDC says don't wear a mask. Even the CDC says wear a mask. They're scientists!

Of course it's real.

Your logic would make perfect sense in Rational World. However, don't live there. We live in Clown World, where black is white, down is up, and legitimate questions are conspiracy theory.

Thank you so much. Your

clear writing is a lifesaver to me. I'm not trained as scientist, but I am educated in using one's mind and consciousness.

I'm 80 years old, but my terrain is healthy. I live a very active life, but so many folks in my contact profile are afraid. How do I answer, "But x number have died", etc, etc? It is my understanding that you can't die from an unidentified virus or any virus, for that matter. It's all the biology of your terrain and your body's ability to keep an unknown "germ" from upsetting your microbiome.

Anyway, I read your emails before anything else in my inbox.

Thank you for your valuable contribution to reason and sanity.

Donna

How do we stop this crazytrain of govt/corporate fascist attack on everyone of us trying to make a living?
