

Computerized Thermographic Imaging and Live Blood Analysis Post C19 Injection

Shocking New Images – Stop The Shots Now!

In this interview with Brazilian biologist and medical researcher Felipe Reitz we discuss his findings of live blood analysis and thermographic Imaging of C19 injected individuals. A thermogram is a regional temperature map of the surface of a part of the body, which is obtained by an infrared sensing device. This measures radiant heat and subcutaneous blood flow. Thermography has been proposed as a noninvasive way to detect deep vein thrombosis, which are blood clots in the venous system.

Thermography and plethysmography, a non-invasive alternative to venography in the diagnosis of deep vein thrombosis

In these never-before-seen images of individuals who received the experimental mRNA shot, we can see extensive abnormal vein imaging suggesting blood clotting in both deep venous and superficial venous system. These individuals are completely asymptomatic and do not feel anything, nor do they have swelling.

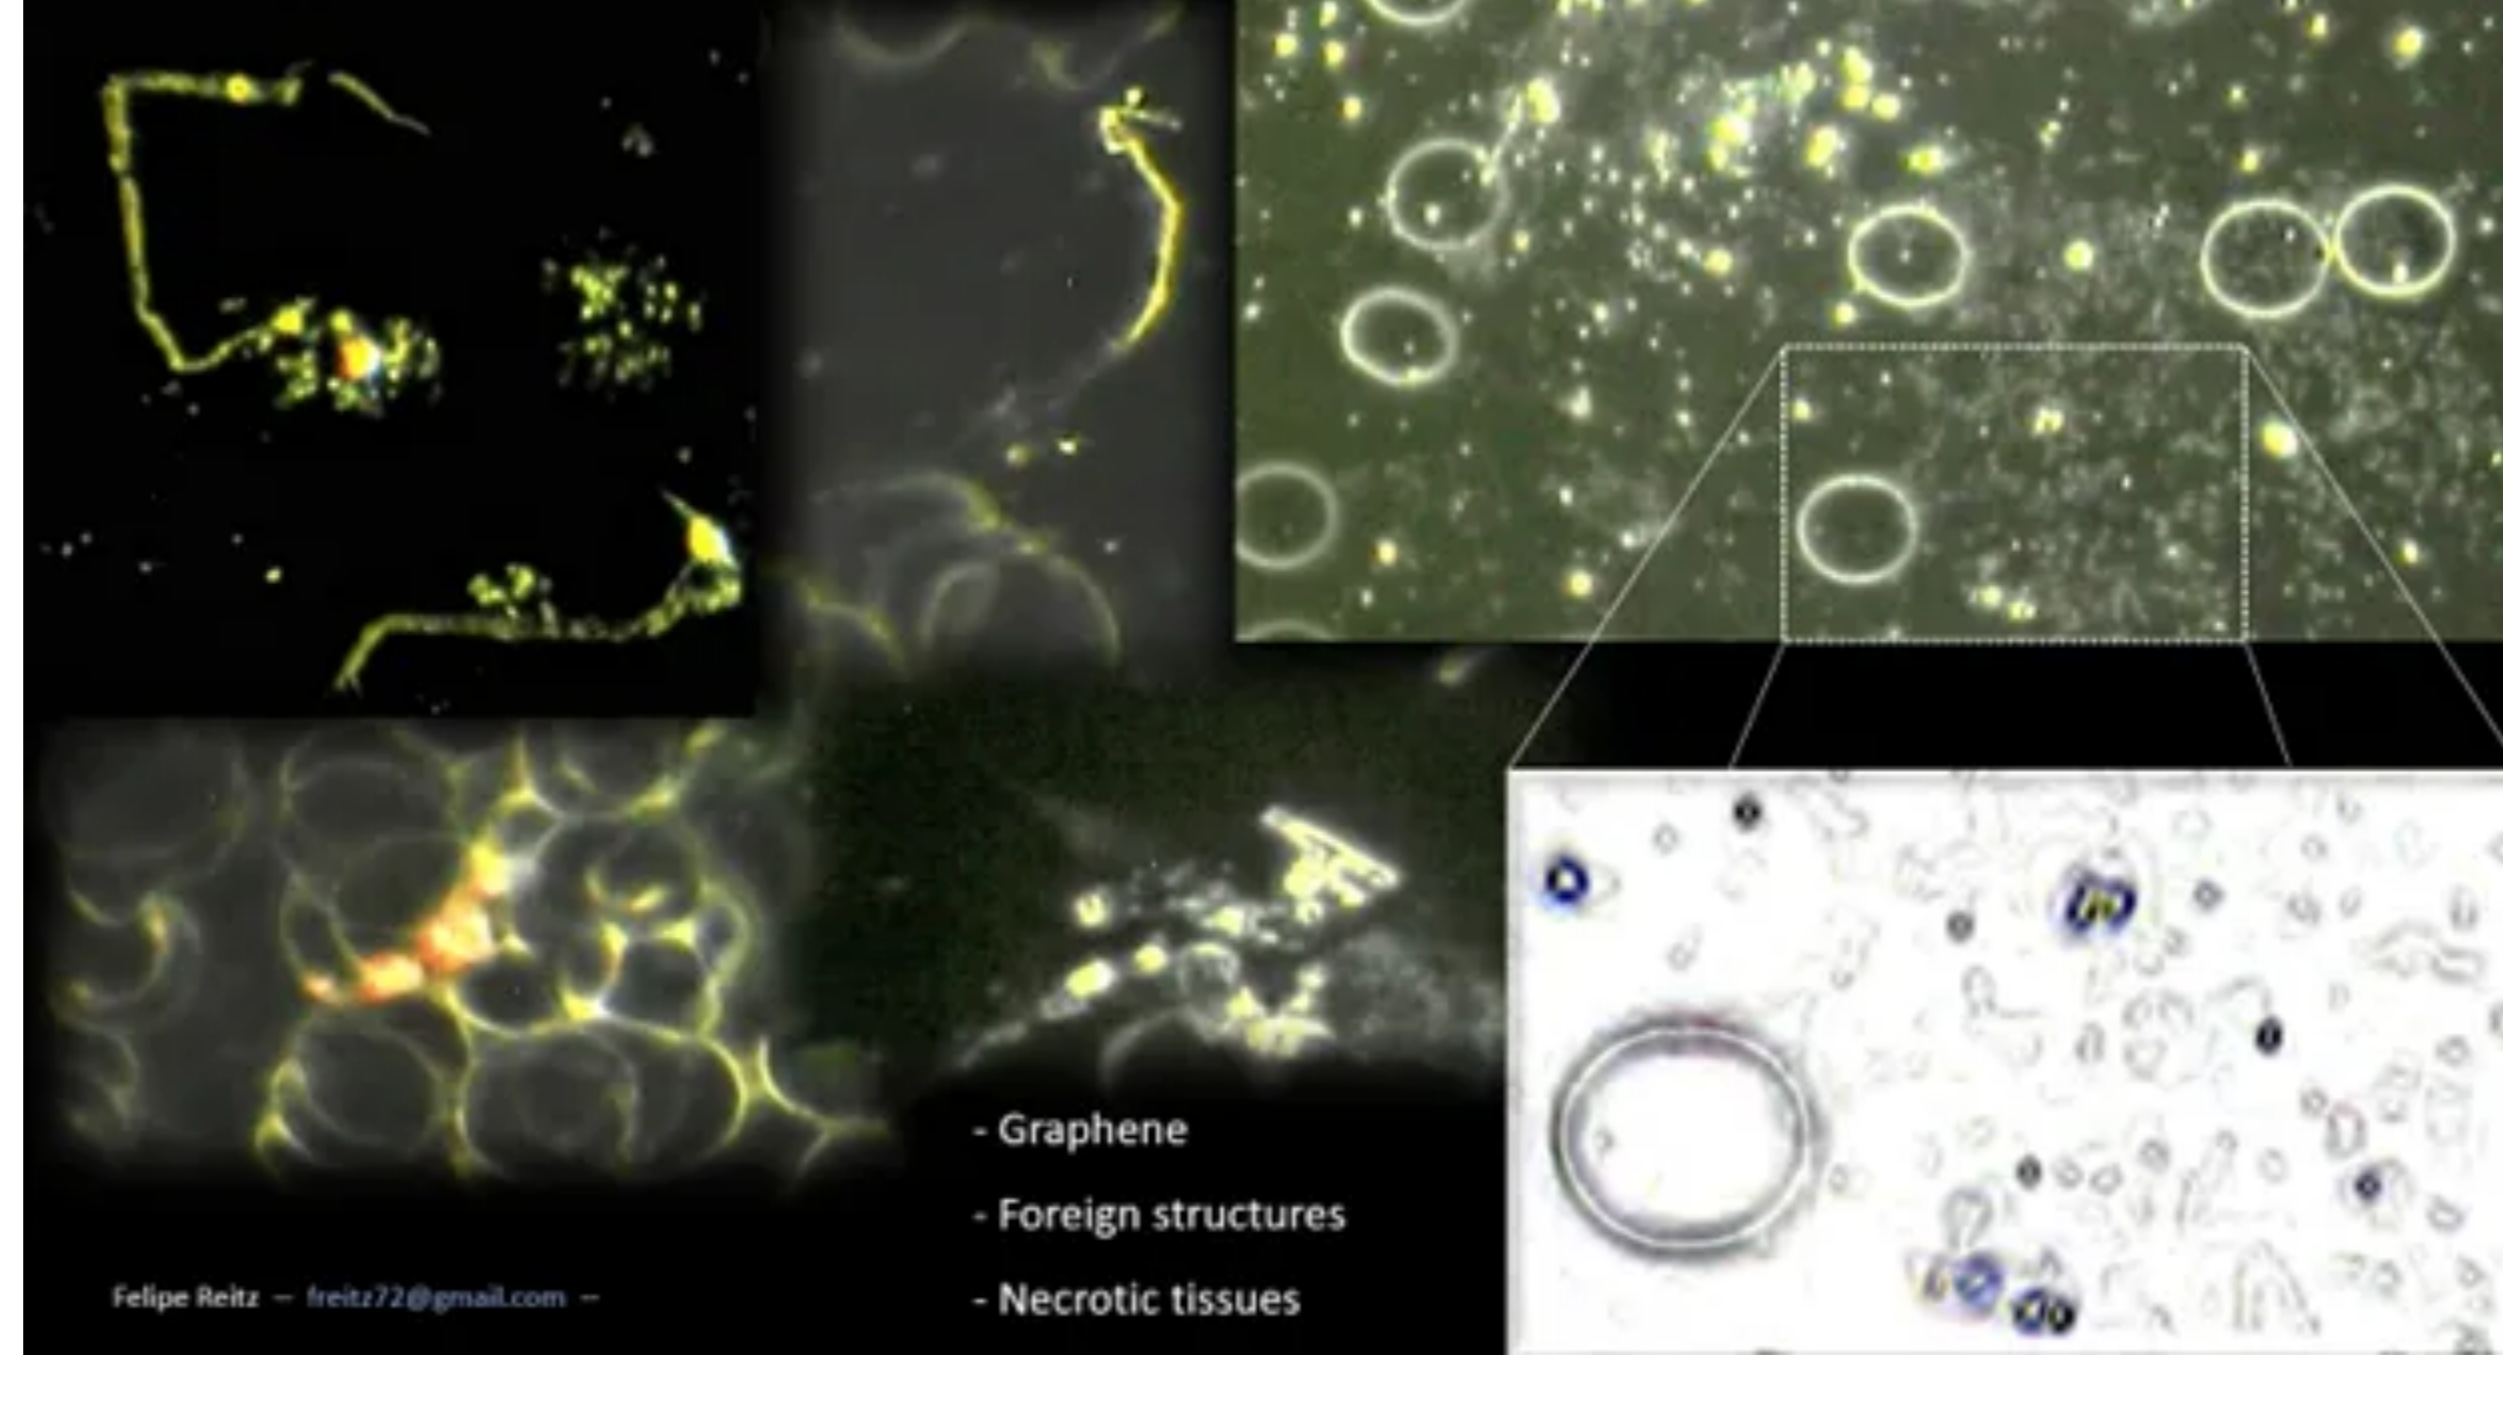

Additionally, we are discussing the blood analysis findings of vaccinated individuals compared to unvaccinated.

Watch our presentation and discussion of the shocking findings here:

[Computerized Thermographic Imaging and Live Blood Analysis post C19 injection](#)

We correlate the Live Blood Analysis findings with the Thermographic Images.

Recent analysis of C19 shot vials have shown self-assembly nanostructures.

I have written about the results around the world.

Most recently, Mike Adams from Natural News examined the chemical composition of blood clots of injected individuals who died with extensive self-assembly blood clots. The composition showed that this is not the same composition as normal human blood clots, but he found metals like Aluminum, Tin and Sodium that are electrically conductive.

You can find more about the clot analysis here:

[EXCLUSIVE: Natural News releases post-vaccine clot ICP-MS elemental analysis results, comparing clots to human blood ... findings reveal these clots are NOT "blood" clots](#)

Summary:

These shocking thermographic images suggest extensive subcutaneous and deep vein blood clotting in C19 injected individuals. Dark Field Microscopy complements the analysis of these individuals, showing what potentially could be Graphene Hydroxide or nanostructures of other metal composition. These alarming findings should alert health care practitioners to screen people who received the gene modifying injections for blood clots, even if they are completely asymptomatic. Thermography may be a noninvasive safe way to do so. Felipe has now also seen this in children as young as 2 years old. This visual proof of harm should galvanize every health care provider to stop giving the shots and every person to stop accepting them.

Thank you for this. I am an unjabbed senior who had a moderate case of the Cov in early January 2022. I had many symptoms that had never occurred with previous flus and pneumonia. Among them, severe HD with elevated D-dimer, ferritin, and lactate dehydrogenase. I had these factors. Amongst them, severe and all were reduced, but D-dimer was still elevated at 0.89mg/L and LDH at 244. Doc thinks it is nothing to worry about but he said it is OK to take an 81mg aspirin. This seems to me to indicate an ongoing presence of clotting factors or micro-clots.
Is it possible that the thermographic results are also present in the unjabbed victims of Cov?
