

Could Glyphosate Be Causing Alzheimer's Disease?

August 16, 2022

Previous Next

New research published in the Journal of Neuroinflammation shows that glyphosate – the active ingredient in Roundup – penetrates the brain and elevates the risk of neurologic disorders such as Alzheimer's disease.

This is the first time scientists have been able to show that glyphosate can cross the blood-brain barrier. They also "noted that the recent rise in glyphosate application to corn and soy crops correlates positively with increased death rates due to Alzheimer's disease and other neurodegenerative disorders," according to journalist Carey Gillam.

So here is what people not connected to farming do not know. Even those connected haven't completely figured it out due to the massive lies. These chemicals do not go away. despite Monsanto's lies that they are gone in 3 years, making the crops organic. These are forever chemicals that destroy soil fertility. They create the need for more and more fertilizer--they are killing the soil bacteria, the very thing that makes minerals available to plants and therefore to us. Blaming farmers for depleting the soil is not quite fair, and is done by the powers-that-be to make those who do not understand the truth hate these hard-working, though deceived, folks.

In the old days, cattle were important for soil fertility--could this be part of why they are being banned by evil people? Most of us, but not all, need animal protein to be healthy, so taking it away weakens us, also part of the plan. Even if a farmer refuses the chemicals, they come anyway, via wind and water, and are unstoppable. You cannot prevent encroachment with fences or walls. I grieve that our wonderful soil has been destroyed and will not come back. It was a clever way to destroy not only our country, but our world.

The chemical's half-life depends on the acidity of soil or water, as it is water soluble. Could persist 20 years or more in a highly acidic environment.

Glyphosate is not the only active ingredient in Roundup, it also contains adjuvants designed to make cell walls more permeable, which maybe how it is able to bypass the Blood Brain Barrier too! A rat study, I think an Italian one, helped reveal some of this. Many vaccines also contain adjuvants designed to make cell walls more permeable, which is probably why they can also cause brain damage.

Yes, Dr. Stephanie Seneff has written descriptions, her theory of how glyphosate and aluminum can bind, then glyphosate drags al across the bbb to locations deeper than al would penetrate on its own, (minus the chemical). Her new book "Toxic Legacy" is in print, may need a lay person version to get through it...[www.amazon.com/.../ref=sr_1_1](#)

This wouldn't surprise me in the slightest. Glyphosate is one of those vile chemicals that enriches the manufacturer and harms everything else. It's been proven many times to cause cancer but unfortunately (just like DuPont's Teflon) they pay the millions in damages and feel no pain because the profits are so vast. It's all SO wrong.

I think they may be using glyphosate as a dessicant for speeding up harvest time with peas and beans too. Can anyone confirm that? This is a concern when considering which dry goods to store during prepping.

Chickpeas and other legumes have high levels of toxic residue. You will want to check the EWG website for add'l information. How the EPA/FDA can continue to allow late season spraying, just prior to harvest is beyond the imagination. Someone(s) must be promised plum corporate positions after they leave govt service. Not much else makes sense.
