

Here's what happens when you investigate why young people are dying

You find that the vaccine killed them. But here in the US, we don't want to look. That's how science works: don't ask, don't tell.

Executive summary

As Dr. Ryan Cole has said many times, “You can’t find what you don’t look for.”

In Japan, they decided to investigate the death of a 14-year old girl who died two days after she got the “safe and effective” booster shot for kids.

What they found is that the vaccine attacked multiple organs and killed her.

Now ask yourself, was this the ONLY child in the world to get “unlucky”? I don’t think so. I think this is the norm for kids who die and we just don’t want to look.

Here’s the tweet:

Steve Kirsch ✓ @stkirsch · Apr 3

This is a big deal. The vaccine caused inflammation leading to death in a **14-year-old**. That was not bad luck. This is happening to kids everywhere to a greater or lesser extent. For kids when it happens to a greater extent, they die.

Here's the abstract

A 14-year-old Japanese girl died unexpectedly 2 days after receiving the third dose of the BNT1262b2 mRNA COVID-19 vaccine. Autopsy findings showed congestive edema of the lungs, T-cell lymphocytic and macrophage infiltration in the lungs, [pericardium](#), and [myocardium](#) of the [left atria](#) and [left ventricle](#), liver, kidneys, stomach, [duodenum](#), bladder, and diaphragm. Since there was no preceding infection, allergy, or [drug toxicity](#) exposure, the patient was diagnosed with post-vaccination pneumonia, myopericarditis, hepatitis, [nephritis](#), [gastroenteritis](#), [cystitis](#), and [myositis](#). Although neither type of inflammation is fatal by itself, [arrhythmia](#) is reported to be the most common cause of death in patients with atrial myopericarditis. In the present case, arrhythmia of atrial origin was assumed as the cause of cardiac failure and death. **In sudden post-vaccination deaths, aggressive autopsy systemic search and histological examination involving extensive sectioning of the heart, including the [atrium](#), are indispensable.**

Summary

If we are going to find any vaccine deaths, we have to be doing proper autopsies (including the requisite stains on any relevant tissue samples) on people who died after the COVID vaccine. We are simply not doing this in the US. That's why nobody is dying from the vaccine.

There is no interest from any authority anywhere in the world to do these autopsies. No country. No state. Not even Florida!

I wonder why that is? They could just do it for a month and see what happens, couldn't they? It would resolve quickly and definitively who is spreading the misinformation, wouldn't it?

POLL

Should we do autopsies and check for COVID vaccine involvement in people who die? In <7 days. we'd know

the truth.

Yes, do the autopsies.

I believe DeSantis did have a roundtable and was wanting to launch a big investigation about the "safety and efficacy" of the vaccines, but I'm pretty sure that was stonewalled, unfortunately.

Autopsies are not usually done anyway for a number of reasons:

1. They are very expensive and insurance does not cover the cost because coverage ends with your death. The cost is out of pocket and although I don't know the cost I would not be surprised if they were about 10K.
2. The coroner (government employee) will do an autopsy in any case in which foul play is suspected. But the coroners, as government employees, frequently have reasons for not doing them.
3. The type of autopsy required in cases such as these are high level and may be beyond the capability of most county coroners.

Overall, autopsies are infrequently done because of cost.
