More research has been published highlighting more problematic side effects linked to COVID-19 shots. Last week, we published our latest update on rare cases of heart inflammation that have been linked to the mRNA COVID jabs, including the jabs from Pfizer-BioNTech and Moderna. After a hurried secret meeting with its advisory board on vaccine safety, [the FDA reluctantly release](#) a warning asking patients experiencing these symptoms to seek help immediately.

The latest study, published in [JAMA's Cardiology Journal](#) on Tuesday, showed that 23 male soldiers (including 22 who were deemed "previously health") between the ages of 20 and 51 presented "acute onset of

On a long enough timeline the survival rate for everyone drops to zero.

care for chest pain in the military health-care system following COVID-19 vaccination and were subsequently diagnosed with clinical myocarditis

were included in the case study.

All the members who tested for myocarditis (for those who aren't familiar with it, myocarditis is a condition that causes the swelling of the heart muscle and can cause difficulty breathing, heart failure, and death) were all "physically fit by military standards and lacking any known history of cardiac disease, significant cardiac risk factors, or exposure to cardiotoxic agents."

All of the patients whose data was included in the study underwent electrocardiography and echocardiography tests. Abnormal electrocardiography findings were recorded in 19 patients (83%): findings included ST-segment elevations, T-wave

inversions, and nonspecific ST changes. Echocardiography in 4 patients (17%) demonstrated reduced left ventricular ejection fractions (40% to 50%).

The cardiac symptoms faded within a week of onset for 16 patients, while 7 others continued to have chest discomfort at the time of this report; follow-up is ongoing.

As one table from the study showed, the number of cases of heart inflammation reported in the military is much higher than the rate that one might expect given population-wide incidence of these symptoms. This suggests some new variable is likely causing the surge in cases.

Table 3. Expected vs Observed Cases of Myocarditis in Military Health System Patients Based on Number of Messenger RNA (mRNA) COVID-19 Vaccine Doses Administered

Doses of mRNA COVID-19 vaccine (through April 30, 2021)	No. of myocarditis cases	
	Expected ^a	Observed
2 810 000 Total doses	2 to 52	23
1 065 000 Second doses	1 to 20	20
544 000 Second doses to military members	0 to 10	19
436 000 Second doses to male military members	0 to 8	19

^a Expected number is based on an expected annual incidence ranging from 1 per 100 000 person-years to 22 per 100 000 person-years^{5,6} presenting within a 30-day period after vaccination.

The study's authors concluded that while the overall risk for patients who received an mRNA vaccine remains extremely small, the US isn't alone in discovering these cases. Israel, which also relied on mostly on mRNA vaccines to inoculate its population, is also seeing surprisingly high incidence of heart inflammation [that's likely linked to the vaccines.](#)
